Elizabeth Jordan

Team Member Evaluation

Today our team made a game plan for our daily journal app. I think the work load was divided pretty evenly as we were deciding how we wanted to go about the project. First, we all discussed what we wanted the app to have included, like a calendar view. We also discussed what the writer could do for each of the prompts, like add voice recordings and fill out a feelings evaluation. After discussing the main idea of our app, we split up and got to work.

Elizabeth Jordan- For my part of the planning, I planned out a lot of the architecture and key functionality of the app. I talked about the organization of the app and what will be included in each view. After doing the rough draft of this, everyone else looked over it and added suggestions for what else the app can include that I might have missed.

Daniel Petruso- Daniel created a visual display for what our app will look like. He used an application to create the visual display, and implemented all of the ideas we talked about. These ideas include the calendar view where you can access past prompts. This calendar view displays whether or not you completed the prompt on each given day as well. He also included the add prompt form, where you can see the emoji slider bar, and the option to add media.

Jeremy Ford- Jeremy filled out the application concept, the components section, and the work breakdown. He gave the overall description of the app and talked through, in terms of actual coding, how we can go about creating the app.

LeeLee Liang- LeeLee did the background research that went into creating the app. She looked at other daily journal apps and resources to find out what we can do to improve our app. It was her idea to implement the emoji aspect of the slider bar.

Overall, I think the work that we did in our main meeting was distributed very evenly and we all contributed to the overall image in different ways. I am excited to start actually creating the app with this group as I think we will work well together.
